SOURCE Tekhnika-Molodezhi, No 5, 1951.DEFINES CONSTANT-FLOW METHOD OF SOVIET PRODUCTION

Il. Kasitskiy

[This article explains the difference between two methods of production  
 which have often been assumed to be identical.]

The first characteristic of constant-flow (potochnyy) production is the  
 detailed division of labor within an enterprise and the breaking up of the produc-  
 tion process into the simplest operations, which promote more rapid and com-  
 plete mastery of operations by each worker.

The second characteristic of the constant-flow method (potok) is the fix-  
 ing of each operation at a specific location.

The third characteristic is the distribution of working positions in  
 strict conformance with the progression of the technological process. This  
 means straightening out the path of the workpiece during its processing and  
 eliminating superfluous and return movements.

The fourth and most characteristic feature is the continuity of the pro-  
 duction process; that is, the consecutive movement of the workpiece from one  
 working position to the next, without stops or interruptions. This can be  
 achieved by extensive and efficient use of various types of transport methods.  
 Transport methods, including the conveyer, are a very important factor for  
 constant-flow production. However, it is not correct to identify the conveyer  
 with the constant-flow method, as has often been done up to now. The constant-  
 flow method can be effective in many branches of industry without the use of an  
 expensive conveyer.

STAT

There are constant-flow methods in which parts are not transported at all. For example, a building under construction, a ship, or large machine can be manufactured with continuity by shifting the working positions.

Finally, the fifth characteristic of constant-flow production is its rhythm. This means the uniform spacing of operations. For this, the order of work and working positions must be so established that all operations will be synchronized; that is, their duration must be either equal in intervals or in multiple proportion of intervals.

For example, if in machining a workpiece, one operation takes 12 minutes, the next one, performed by another worker, takes 16 minutes, and the operation of a third worker, only 5 minutes, this work can be made rhythmic by means of various changes in technology and organization of production, so that the first operation will be performed in 10 minutes and the second in 15. Thus, the rhythm will comprise 5-minute intervals.

[The constant-flow method is similar to that described under "Fordism," Bol'shaya Sovetskaya Entsiklopediya, Vol 58, Moscow, 1936, p 131 ff; and "Mass Production," Encyclopedia Britannica, Vol 15, Chicago, 1947, p 39 ff.]
